Linda Mikitish is a Health & Well-Being Nurse Coach with St. Luke’s Department of Lifestyle Medicine. Preceding this role, Linda worked with heart and lung patients as a transitional care nurse. She comes alongside patients to help them become better self-managers of their chronic conditions such as heart failure, heart disease, COPD and diabetes.

Credentials:

Registered Nurse
Certified Heart Failure Nurse
Guided Care Nurse
Certified Health & Wellness Coach
MEDICATION ADHERENCE: OVERVIEW

MEDICATION ADHERENCE 3 PART SERIES

Webinar 1 - Today, Oct 10, 2018
  ➢ Medication Adherence Overview

Webinar 2 - Oct 17, 2018
  ➢ Medication Adherence: Managing Cost

Webinar 3 – Oct 24, 2018
  ➢ Medication Adherence: Strategies and Tools
MEDICATION ADHERENCE

Today’s Learning Objectives

- Learn why this is such an important and complex topic
- Identify the primary causes of medication non-adherence
- Discover a couple tools to assess medication adherence
- Discuss common barriers to medication adherence
- Begin discussion of how those working in the community can have a role in improving medication adherence
THERE IS NO SILVER BULLET, BUT...

“Do what you can, where you are, with what you have.” – Theodore Roosevelt

“Put your heart, mind and soul into even your smallest acts. This is the secret of success.” – Swami Sivananda

- Medical providers suffer from a chronic lack of time and to be efficient the provider must control the conversation.

- The community health worker, EMT, and/or paramedic has the unique opportunity to sit and be present with patients – listen and discuss topics that are important to that individual including medications.
“In the United States, some 3.8 billion prescriptions are written every year, yet over 50% of them are taken incorrectly or not at all.”

“In a survey of 1000 patients, nearly 75% admitted to not always taking their medications as directed.”

“A study of over 75,000 commercially insured patients found that 30% failed to fill a new prescription, and new prescriptions for chronic conditions such as high blood pressure, diabetes, and high cholesterol were not filled 20%-22% of the time.”

“Poor compliance accounts for 33%-69% of drug-related adverse events that result in hospital admissions.”

Neil Chesanow, Medscape

“WHO reported that adherence among patients with chronic diseases averages only 50% in developed countries. This is recognized as a significant public health issue, since medication nonadherence leads to poor health outcomes and increased healthcare costs.” *Lam and Fresco*

“Medication non-adherence has important health consequences, ranging from decreased quality of life and poorly managed symptoms to death. But the implications of medication non-adherence extend beyond the individual; non-adherence is also associated with significant societal costs. Upwards of $300 billion of avoidable health care costs have been attributed to medication non-adherence annually in the U.S., comprising up to 10% of total health care costs.” *Zullig and Bosworth*
THE $290 BILLION QUESTION – WHY?  
THE ANSWER – IT IS COMPLEX AND MULTIFACTORIAL!

“Drugs don’t work for patients who don’t take them.”
C. Everett Koop, MD, Former US Surgeon General
Three Primary Causes of Medication Non-adherence:

1. Knowledge deficits related to the purpose and importance
2. Concern about side effects
3. Financial burden

Never/Rarely......................
Once in a while......................
Sometimes.........................
Usually...........................
All the time.......................
A good place to start!

- Get the right prescription
- Fill the prescription
- Adhere to the prescription for 6 months when risk of non-adherence is the greatest
- Take the medication indefinitely as prescribed for a chronic condition
WHAT ELSE TO CONSIDER?

Physiological Factors

- Memory loss
- Hearing and/or vision loss
- Mobility limitations
- Presence of symptoms
- Cognitive impairment
WHAT ELSE TO CONSIDER?

**Behavioral Factors**
- Social isolation
- Social and health beliefs
- Economic condition

**Treatment Factors**
- Duration and complexity of medication regimen
- Type of medications
- Patient’s perception of the medication
WHAT ELSE TO CONSIDER?

Communication/Relationship

• Quality and content of physician and pharmacist instruction

• Content of pharmacy label - font, colors, language...

• Patient’s ability to ask questions/communicate concerns and/or issues
Populations at highest risk:
- Older adults
- Racial and ethnic minorities
- Lower level of education – less than high school degree or GED certificate
- Low income
- Non-native English speakers
- People with compromised health status

“Only 12% of adults in the US have Proficient health literacy”

“Fourteen percent of adults (30 million people) have Below Basic health literacy”

U.S. Department of Health and Human Services
Office of Disease Prevention and Health Promotion
EIGHT STEPS TO IMPROVE MEDICATION ADHERENCE

1. Consider medication nonadherence first as the reason a patient's condition is not under control
2. Develop a process for routinely asking about medication adherence
3. Create a blame-free environment to discuss medications with the patient
4. Identify why the patient is not taking their medicine
5. Respond positively and thank the patient for sharing their behavior
6. Tailor the adherence solution to the individual patient
7. Involve the patient in developing their treatment plan
8. Set patients up for success

Christine Sinsky, MDAMA, Medical Associates Clinic and Health Plans
WE CAN BE FACILITATORS OF CONVERSATIONS TO IMPROVE MEDICATION ADHERENCE

What providers can do to improve adherence…

- Simplify regimen
- Discuss reminder system
- Involve family/significant others
- Stress the importance of honesty
- Facilitate shared decision-making & mutual goal setting
- Contract with patients
WE CAN BE FACILITATORS OF CONVERSATIONS TO IMPROVE MEDICATION ADHERENCE

What patients can do to improve adherence…

- Ask about once a day dosing
- Ask when the medication will start to improve symptoms, and which symptoms will improve
- Ask what will happen if symptoms don’t improve at that time
- Have a reminder system
- Involve family/significant others
“Patients are often stripped from their individuality, are observed, and given medication recommendations out of context with their daily life. Community health workers go to their home and can see what is happening. The act of witnessing has allowed a lot of honest dialogue.”

Heidi Behforouz, MD

“I’m not telling you it’s going to be easy - I’m telling you it’s going to be worth it.”

-Art Williams

Life is not about waiting for the storm to pass, it’s about learning to dance in the rain.
